## IN THE ABSTRACT

1

Please replace the paragraph beginning on page 19, at line 14, with the following:

mounting frame is pivotally connected at its rearward end to the ATV rearwardly of the

forward end thereof. A hinge plate is pivotally mounted, about a vertical axis, to the

forward end of the mounting frame and has the blade of this invention mounted thereon

to enable the blade to be pivoted left, right, or positioned in a straight position. The

blade is locked in its various positions by a blade position lever. A linkage is mounted

on the forward end of the push tube assembly which is operatively connected to the

blade position lever for moving the blade position lever between its locked and unlocked

positions. The blade position lever is automatically moved to its unlocked position upon

the linkage engaging the underside of the ATV. A winch is operatively connected, in a

slip clutch fashion, to the hinge plate to enable the blade to be pivotally moved, about a

vertical axis, between its various angular positions, when the blade position lever is in

its unlocked position through the linkage means.

A blade attachment for an off-road vehicle such as an ATV is provided. A
